

This update delivers a built-in Help Centre across every module — searchable articles for Customers, Inventory, Reports, Creditors, BAT Reconciliation, Administration, and Hub & Backups — with a sidebar shortcut that puts help and settings one click away from wherever you are in the app. The full user manual can be printed or saved as a PDF directly from /manual. Head-office users gain new tools on the Hub Backups page: a per-site indicator confirms SQL database backups have reached the off-site repository, snapshot trees can be browsed in the app, and snapshots can be deleted or maintenance run from the viewer without leaving Cardoso.

New Features

NEW

■ Built-in Help Centre with articles for every module

A full Help Centre is now available inside the app. Articles cover every module — Customers, Inventory & Reports, Administration, BAT Reconciliation, Creditors, and Hub & Backups — and can be searched by keyword. Find answers without leaving the page you are working on.

■ Help and Settings accessible from the sidebar

A Help flyout and a Settings flyout are now reachable from icons in the sidebar, so you can look something up or adjust a setting from anywhere in the app without navigating away from your current screen.

■ Printable user manual at /manual

The complete user manual is available at /manual as a single print-ready page. Print a reference copy or save it as a PDF to share with your team.

■ Settings tabs are bookmarkable and shareable

Settings panels can now be deep-linked using ?settings=<tab> in the address bar. Bookmark a specific settings section or share a direct link to it with a colleague.

■ Verify SQL backups reached the off-site hub, and manage snapshots

The Hub Backups fleet table now shows a per-site indicator confirming whether each site's SQL database backup has been uploaded to the off-site repository. Snapshot trees can be browsed directly in the viewer, and you can delete individual off-site snapshots or trigger repository maintenance without leaving Cardoso.

Fixes

FIXED

■ Sidebar navigation is cleaner

The subsystem health strip has been removed from the sidebar, keeping the navigation uncluttered. System status and backup health remain available on the dedicated Hub Backups page.
