

This update (v2026.5.9.3) sharpens the money pages. Creditor Balances now shows each vendor's TRUE position — including invoices and payments still sitting in unposted batches — with a plain-language breakdown and a Cashbook capture warning so you always know how far behind posting is. The credit-risk verdicts on Customer Balances have been rebuilt to be both more accurate and fully explainable. Both balance pages gain in-place detail popups, creditors get a dedicated search page and a printable report, and overnight syncing is more resilient with automatic retries and clear staleness warnings. Every figure continues to be drawn from, and reconcile to, Sage.

New Features

NEW

■ True creditor position — including unposted batches

Creditor Balances now shows what you ACTUALLY owe each vendor, not just what Sage has finished posting. When accounts are behind on posting batches, the figure is corrected on screen and the maths is spelled out so it always adds up.

- Each vendor's Outstanding is Sage's posted balance PLUS invoices captured in unposted batches (which Sage understates) MINUS payments captured but not yet posted (which Sage overstates).
- A headline line spells out the arithmetic: Total Outstanding + unposted invoices outstanding, for the vendors currently shown.
- Affected vendors carry an amber dot; hovering a row shows a breakdown card (posted vs unposted, with the true figure) that follows your cursor.
- A Cashbook capture line states the date vendor payments were last captured and how many days behind that is — turning red past a week — so figures are never mistaken for 'includes last week's payments'.

■ Vendor detail popup and a dedicated Creditor Search

The full vendor picture now opens in a popup, and creditors get their own 'Search the creditors' page that mirrors Customer Search.

- Click a vendor on Creditor Balances — or look one up on the new Creditor Search page — to open a popup with the vendor's receipts, open invoices, payments, and purchase orders. Closing it leaves you exactly where you were.
- Creditor Search opens with a clean overview: vendor count, true outstanding, and unposted-batch totals, plus a last-sync card and a payment-capture status strip.
- Creditor Balances gains a Print / PDF button with the same letterhead as Customer Balances, and the sync controls now sit tidily on the headline row.

■ Open the full customer popup straight from Customer Balances

Clicking a customer on the balances table now opens the same full customer popup you'd get from a search — without leaving the page.

- The popup carries the customer's credit verdict, recent invoices and receipts, and flag actions; closing it returns you to the balances list with your filters intact.
- Hovering a row shows the credit verdict and the reasons behind it in a prominent card that follows your cursor (see Improvements).

■ Show or hide small balances on Customer Balances

A previously fixed 'hide anything under R3' rule is now an option you control.

- A new Minimum balance filter offers Off / R3+ / R10+ / R100+ / R1 000+, so you can surface tiny balances or focus on material ones.
- The choice is part of the page link, so a filtered view can be bookmarked or shared.

■ Creditors at head office

Creditor balances and aged-creditor figures are now available on the head-office (hub) view, per branch, alongside the existing debtor reports.

Improvements

IMPROVED

■ Credit-risk verdicts — accurate and fully explainable

The credit verdict shown against each customer has been rebuilt so it reflects how the account actually behaves, and so you can always see WHY a verdict was reached.

- Payments now settle invoices by VALUE, oldest first — a small same-day receipt can no longer 'clear' a large invoice.
- Each account is judged against its OWN payment terms (e.g. 7-day vs 30-day) instead of one blanket threshold.
- Prepaid (PP) accounts with any outstanding balance are held — no new credit until they are clear.
- Payment reversals are no longer mistaken for payments, and tiny rounding residues (under R10) no longer trigger a hold.
- Hovering a customer row shows a prominent card with the verdict, its score, the contributing factors, and — when an account is held — the exact offending invoice (number, amount and date).
- Average days-to-pay, exposure limits, flag history and dormant-account detection all continue to work, now fed accurate inputs.

■ Overnight syncs retry themselves, and warn when data is stale

Sites no longer quietly run on yesterday's numbers when an overnight sync misses.

- A failed nightly sync now retries automatically a short time later.
- If data is more than about a day old — for example because a machine was switched off — the app says so plainly instead of silently showing stale figures.

■ Branch shown in front of top customers at head office

On the head-office reporting dashboard, viewing all branches now prefixes each top customer with its branch name — matching the Top Dead Stock card.

■ Smoother app during head-office data loads

Large head-office syncs no longer make the interface stutter, and a new safeguard catches the rare freeze.

- Head-office data is now written in small yielding chunks, so the screen stays responsive while a sync runs.
- A background watchdog detects and reports any unexpected freeze, so stability issues surface instead of going unnoticed.

■ Consistent buttons and tidier list pages

Several pages were brought in line with the app's look and feel.

- The Inventory list's Print, Export CSV and Refresh buttons now match the Customer Balances styling.
- Vendor lookup moved off Creditor Balances onto the dedicated Creditor Search page, leaving Balances as a clean overview.

- **Creditor totals now agree across pages**

The 'true outstanding' figure on Creditor Balances now reconciles with the Creditor Search overview — a filter had been quietly excluding part of the total, so the two could disagree.

- **Last payment dates and missing payments surfaced**

Where vendor payments existed only in the Cashbook (captured but not yet posted), the previous view could show an out-of-date 'last payment'. The true position and the capture-date warning now make this visible rather than misleading.
