

This update (v2026.5.9.3) extends the Creditors module with a true-position view that accounts for unposted AP invoices, Sage payment batches and cashbook entries, so the vendor outstanding is always accurate — not just what has posted. Creditor Balances is now available at head office, consolidated across branches with a branch filter. On the customer side, a configurable minimum-balance filter and an inline drill-through on the Balances page make it faster to work with large debtor lists, and the credit-assessment verdict now appears as a cursor-following card that names the specific invoice behind a hold. Reliability is improved too: nightly syncs retry automatically, catch up after missed nights, and alert when data goes stale, and the application now detects and recovers from main-thread freezes without needing a manual restart. Every figure continues to be drawn from, and reconcile to, Sage.

## New Features

NEW

### ■ Creditor Balances — true position including unposted amounts

The Creditors page now shows your real position with each supplier: outstanding amounts include unposted AP invoices, Sage payment batches waiting to post, and cashbook entries in progress — not just amounts already in the ledger.

- Unposted AP invoices (at every stage before posting) are included in the vendor outstanding.
- Payment batches captured in the cashbook but not yet posted are netted off the balance.
- A 'how far behind is payment capture' indicator under the aging tiles shows if posted and unposted amounts are diverging.
- A cursor-following popup on the Balances table breaks down the posted versus unposted split for any vendor.

### ■ Vendor detail opens as a popup

Drilling into a vendor from Creditor Search or from the Creditor Balances table now opens in a popup on the same page, keeping your place in the list rather than navigating away.

### ■ Print Creditor Balances

A print button has been added to the Creditors page, matching the Customer Balances print experience. Vendor search has been removed from the header to give more space, and the sync controls have moved below the tiles.

### ■ Creditor Balances at head office

The hub now shows Creditor Balances consolidated across all branches, with a branch filter to focus on a single site. Balances are backed by the same ETL pipeline that powers the rest of the hub.

### ■ Branch label on Top Customers at head office

When viewing the hub at the all-branches level, the Top Customers card now shows which branch each customer belongs to, making it immediately clear where your biggest accounts trade.

### ■ Configurable minimum-balance filter on Customer Balances

The minimum-balance threshold on Customer Balances is now a filter you can set yourself — previously it was fixed at R3. Raise or lower the floor to focus the list on the accounts that matter to you.

### ■ Drill into customers from the Balances page

Clicking a customer row on the Balances page now opens the full customer lookup popup in place, without navigating away from the list. Review invoices, receipts and account details, then close to return to exactly where you were.

### ■ Credit verdict follows your cursor

The credit assessment result now appears as a prominent card that follows your cursor as you move across the Balances table. The card names the specific invoice behind any credit hold, so you can see exactly what is causing a block without opening the customer record.

- The verdict card replaces the previous row tooltip with a larger, more readable layout.
- The offending invoice reference and amount are shown at the top of the card.

### ■ Nightly syncs retry, catch up, and alert when stale

Nightly data syncs are now more resilient: they retry automatically if a sync fails, catch up on any nights that were missed, and raise an alert when data goes stale — so sync problems are surfaced promptly rather than discovered during a manual check.

## Improvements

IMPROVED

### ■ Creditor Balances shows whole-company outstanding

The outstanding headline on Creditor Balances now always reflects the full company position, not just the subset visible in the current filter. Filter the list to a branch or account type and the header total stays honest.

### ■ Creditor Search styled to match Customer Search

Creditor Search now uses the same layout, spacing and controls as Customer Search, giving both modules a consistent look and making the app easier to navigate between the two.

### ■ Head-office ETL no longer freezes the app

Open-item refreshes at head office now yield control back to the rest of the application during processing, so the app stays responsive while a large ETL run is in progress.

### ■ Application recovers from UI freezes automatically

The app now detects when the main thread has stalled, names the hang for diagnosis, and recovers without requiring a manual restart — reducing the impact of any transient freeze on your workflow.

## Fixes

FIXED

### ■ Credit assessment applies payments accurately

The credit engine now applies receipts in order from largest to smallest with a R10 materiality floor, correctly handles prepaid holds, per-customer payment terms and reversals, and produces a verdict that matches the ledger position.

### ■ Creditor Balances money tiles fit large amounts

The stat tiles on the Creditor Balances page now render at the correct size for vendors with large rand balances, so long amounts are no longer clipped or overflowed.
