

A performance-focused update: the app is noticeably faster across data-heavy screens, search inputs, and report loading. This release also ships a set of accuracy and reliability fixes to commission reporting, sales forecasting, and stock-receipt sync.

Improvements

IMPROVED

■ Faster, more responsive screens

A dedicated performance pass has eliminated unnecessary re-renders throughout the app. Typing in search boxes, sorting tables, and scrolling large lists is now smooth and immediate, with no perceptible lag.

■ Reports load on demand

Individual reports are now fetched only when you open them, rather than all at once on page load. The first screen you see after logging in loads significantly faster as a result.

■ Insights feed loads instantly

The Insights cache is pre-warmed automatically after each nightly sync, so your proactive alerts and baselines are ready the moment you open the feed.

Fixes

FIXED

■ Commission totals now accurate

A row-multiplication issue that could cause commission figures to appear higher than correct has been resolved. All commission reports now show accurate amounts.

■ Reliable commission archiving for closed periods

Archiving commission for a closed period can now be triggered on demand and retries automatically if interrupted, preventing gaps in historical commission records.

■ Forecast calendar gaps corrected

Sales forecasts now account for all calendar periods correctly, giving you complete and consistent projections without missing intervals.

■ Stock-receipt sync handles reversed lines

The stock-receipt sync now correctly reconciles reversed or cancelled purchase lines, keeping your inventory records in step with Sage.
