

This update brings head-office reporting across branches to the whole reporting suite: every report and the Reporting Dashboard can now be viewed for all branches consolidated, or narrowed to a single branch, and the dashboard's sales and inventory highlights now work at head office. It also adds at-a-glance dashboard tiles, a daily sales report, a new customers-by-sales view, and a commission monthly bundle download. Insight cards now deep-link directly to the relevant report tabs, and the sidebar opens to your first accessible group by default for faster navigation. The Sales Commission module defaults VAT to 15%, saving a manual step each month. On-screen help, clearer charts, and several accuracy and permission fixes round out the release. Every figure is drawn from, and reconciles to, Sage.

## New Features

NEW

### ■ Head-office branch filtering across the reporting suite

At head office, every report and the Reporting Dashboard now show all branches consolidated by default, with a Branch selector to focus on a single branch.

- A consistent 'All branches / pick one' Branch selector on Aged Debtors, Aged Creditors, Sales Rep Exposure, Inventory Value and Monthly Sales Figures.
- The Reporting Dashboard gains one Branch selector that filters every card and the headline customer figures together.
- Consolidated is the default everywhere: totals sum across every branch that has reported in, and choosing a branch narrows the same view.
- The dashboard's customer counts and flag totals now read from the consolidated head-office data (previously they could show as zero at head office).
- BAT reconciliation, an operational per-branch process, shows a clear 'open on a branch' note rather than an empty page.

### ■ Reporting Dashboard — sales & inventory highlights

Three new at-a-glance tiles on the Reporting Dashboard surface the month's best sellers, the costliest dead stock and the biggest customers, each as a compact ranked list.

- Top Items Sold this month by units, showing the item code and description.
- Top Dead Stock: the highest-value items still in stock with no sale in the last three months.
- Top Customers by sales value over the last 12 months.
- Inter-branch stock transfers are excluded from all three, so the figures reflect real customer trade.
- At head office these consolidate across branches and follow the dashboard's Branch selector; the underlying figures are brought up from each branch automatically.
- Each tile links through to the fuller view in Trends.

### ■ Daily Sales Figures report

A new report breaking the current month's posted invoices, credit notes and debit notes down by day, with VAT shown separately — the daily companion to the Monthly Sales Figures report.

- Day-by-day rows for the current month with a Net column (Invoices + Debit notes - Credit notes) and a totals row.
- Same Sage source as the Monthly Sales Figures, so the two reconcile.
- Amounts in Rand, exportable to CSV, and printable with the standard header.
- Grouped under the Monthly Reports permission, alongside Monthly Sales Figures.

## ■ Customers by Sales (Trends)

A new view under Trends > Customers that ranks customers by sales value over a timeline you choose.

- Full ranked table of customers by sales value, with a units column and a relative bar.
- Timeline filter: last 3, 6, 12 or 24 months, or all time.
- Inter-branch transfers excluded so the ranking reflects real customers.
- The Customer area now uses the same tabbed layout as Inventory (Record trends / By sales), with the filter in a consistent place.

## ■ Commission monthly bundle download

The head-office hub now lets you download the current month's commission bundle in one click — all branches' PDF reports, zipped and ready to distribute.

## Improvements

IMPROVED

### ■ Insights cards deep-link to the correct report tab

Clicking an Insights card now navigates directly to the relevant tab in the associated report — no extra steps to reach the data behind an alert.

### ■ Sidebar opens to your first accessible group by default

The sidebar now opens fully expanded with only the first group you have access to shown, so the most relevant navigation is visible the moment you open any page.

### ■ Aged Creditors - filter by payment history

The Aged Creditors report gains a Payments filter, on by default, matching the Creditor Balances page and the dashboard tile.

- 'With payment history' (default) hides never-paid accounts; switch to 'All vendors' to include them.
- The choice flows through to the PDF and Excel exports and the printed filter line.

### ■ BAT weekly chart - total value per week

The second chart on the BAT Weekly Reconciliation report now shows each week's BAT and Sage credit-note totals, replacing a variance line that sat flat at zero on a clean reconciliation and carried no useful scale.

- Per-week BAT supplier total and Sage credit-notes total, in Rand.
- The two lines track closely when a week reconciles; a visible gap is that week's variance.

### ■ On-screen help across the new screens

Hover tooltips explain the new dashboard tiles, filters, charts and table columns, so it is clear what each figure means and how it is derived.

- Each dashboard tile explains what it ranks and that inter-branch transfers are excluded.
- Filters and table headers (units vs sales value, timelines, the branch selector) carry short explanations.

### ■ Item descriptions on sold-item figures

Sold-item figures now carry the item description alongside the code, captured automatically as sales are synced from Sage.

- The Top Items tile shows 'code - description' once a sales sync has run.
- Descriptions travel with the sales data, so they are available even where the item master has not been loaded.

## ■ Rand symbols on the sales reports

The Monthly and Daily Sales Figures reports now show the Rand (R) symbol against every amount, for South African currency clarity.

- Consistent 'R' prefix on every figure and the totals row, on screen and in exports.

## ■ Sales Commission VAT defaults to 15%

When running a Sales Commission report the VAT rate now defaults to 15% — the standard South African rate — so it no longer needs to be entered manually each month.

## Fixes

FIXED

## ■ Inter-branch transfers excluded from sales figures

Internal stock transfers between branches are no longer counted as customer sales in the dashboard sales tiles or the customers-by-sales view.

- Previously the largest 'customer' could be an inter-branch transfer account; these are now filtered out so the figures reflect real trade.

## ■ Daily Sales Figures access aligned with Monthly Reports

The Daily Sales Figures report is now governed by the same Monthly Reports permission as the Monthly Sales Figures report.

- Users without the Monthly Reports permission no longer see or can reach the daily figures, closing a gap where the same posted-document totals were otherwise reachable.

## ■ Sage query 'Reset to default' now reverts fully

In Settings > Sage Queries, resetting a query to its default now reliably restores the shipped query.

- On installs upgraded from the older per-module settings, a reset could fall back to a previously saved query; it now clears cleanly to the default.
- The editor also accepts the shipped defaults that begin with a leading semicolon, so they can be copied, adjusted and saved.

## ■ Aged Debtors data sync reports failures honestly

When the nightly Aged Debtors open-item sync cannot reach Sage or hits a bad query, it now reports a failure instead of recording a successful run.

- Previously a failed run could still stamp a 'last synced' time, making stale data look fresh; the sync now surfaces the error to the screen and to the scheduled-job status.

## ■ Commission bundle archive timestamps corrected

Commission bundle archives are now stamped with the correct creation time, so the hub shows the right date and time for each month's bundled report.

## ■ BAT invoice reconciliation and local timestamps

The BAT Cardoso-invoice matching query now works reliably across all server configurations, and all BAT date and time values reflect local South African time (UTC+2) rather than UTC.
