

Where we are taking Cardoso next, organised into three horizons. Dates are planning targets, confirmed with you sprint by sprint — this is a living plan, not a fixed contract. Throughout, our guiding principles hold: Sage is the source of truth, nothing fails silently, and a figure shown in one place agrees everywhere.

Now · June – July

NOW

■ Multi-site reporting at the Hub

Bring the new Sage-faithful reports — Aged Debtors, Aged Creditors and Monthly Sales Figures — fully live at head office, with each branch synced down and shown both per branch and consolidated. One reconciled view of receivables, payables and sales across every depot.

■ Operational visibility

A single screen showing every background process — Sage syncs, backups, reconciliation, exports — with status, last run and last error, and one-click retry. See at a glance that the overnight runs completed, and fix anything that did not.

■ Proactive alerts

Automatic notification when a critical job fails — a sync, a backup, a reconciliation — so problems are known within minutes rather than discovered days later.

Next · July – August

NEXT

■ Transparent access control

A clear view of why a user can or cannot see something, a preview of a user's access before saving, and an exportable permission matrix — so access questions are answered in minutes.

■ Data-quality monitoring

Automated nightly checks that surface duplicates, missing fields and Sage-vs-Cardoso mismatches, with a simple queue of issues to review — catching data problems before they reach a report.

■ Saved views

Let each user save their preferred report and reconciliation filters, with optional shared team presets, for faster day-to-day work.

Later · August – September

LATER

■ Performance monitoring

Visibility into how quickly key screens and exports respond, so slow points are identified and improved before they affect the team.

■ Configuration safety

A safe, secret-redacted view of the system configuration, with warnings for risky combinations and clear “restart required” flags — reducing the chance of a change causing an outage.

- **Incident timeline**

A single, time-ordered view of deploys, job events, alerts and manual actions, so any issue can be understood and reviewed quickly.
