

This update spans mid-May to early June 2026 and represents a substantial expansion of the platform: two new financial modules (Creditors and Sales Commission), a Sage-faithful aging system for both debtors and creditors, new inventory and sales analytics, a reporting dashboard with a proactive insights feed, multi-site consolidation at head office, and a broad set of usability, performance and accuracy improvements. Every figure is drawn from, and reconciles to, Sage. The detail below itemises what each module, improvement and fix delivers.

New Modules & Features

NEW

■ Creditors (Accounts Payable) module

A complete new accounts-payable area for managing supplier accounts, fed from Sage and reconciled and refreshed automatically every night so the figures on screen are always current.

- Creditor Summary screen showing each vendor's outstanding balance, with header totals, resizable columns and a tidy, dense layout.
- Creditor Search to look a supplier up by code or name and drill into its open documents and full payment history.
- Automated nightly sync from Sage built on column names verified against the live Sage database (replacing earlier guessed names), so balances and payments are correct.
- Correct supplier-payment matching, so receipts are applied to the right documents and fully paid vendors drop off.
- A 'has payment history' filter, on by default, that hides never-paid and zero-balance vendors so the list shows who you actually trade with.
- A Settings tab where an administrator can override the Sage query and choose how many months of history to load, with no code change.
- A dedicated access permission (administrators granted automatically), and its own sidebar group ordered to mirror the Customer module.
- A head-office mirror so creditor balances can be consolidated across every branch.

■ Aged Creditors report (Sage Aged Payables method)

A new report that ages every open supplier document the way Sage's Aged Payables trial balance does, instead of dropping a whole balance into a single period.

- Built on a shared, tested Sage-300 aging engine that also powers the Aged Debtors report.
- Ages each open document by its due date into Sage's monthly periods: Current, 1-30, 31-60, 61-90 and Over 90 days.
- Distributes a vendor across several periods document by document, exactly matching the Sage Aged Payables trial balance.
- Reconciles to the live Sage open-item total to the cent.
- Per-period columns with a totals row; downloads as a polished PDF or an Excel workbook that matches the on-screen view.
- Reachable from both the Reports area and the Creditors module (by either permission).
- Head-office all-sites support, with a Site column and correct per-site vendor scoping.
- Credit balances shown with the correct sign, so the screen and the downloads agree.

■ Aged Debtors, rebuilt on the Sage open-item ledger

The customer aging report was rebuilt on a new accounts-receivable open-item ledger synced from Sage, so every open invoice, credit note and debit note is aged individually rather than approximating a customer's whole balance from the oldest invoice.

- A new open-item ledger, synced nightly from Sage, holding each open document with its dates and amounts.
- Sage weekly periods: Current, 1-7, 8-14, 15-21 and Over 21 days, aged by document date to match Sage.
- Each document placed in its own period, so a customer correctly appears across several buckets.
- Customers belonging to a national account roll up under the parent account and inherit its sales rep and account type.
- Reconciles to the live Sage open items rather than a master balance that had drifted from the underlying invoices.
- Sales-rep, account-type, site and minimum-balance filters, with CSV, PDF and Excel export.
- Head-office all-sites support with a Site column.

■ Monthly Sales Figures report

A new month-by-month summary of posted invoices, credit notes and debit notes with VAT separated, sourced live from the Sage invoice batches and matching your existing Sage 'Sales Figures' report to the cent.

- Sourced from Sage's posted invoice batches, with the document type (invoice / credit note / debit note) read directly from Sage.
- Excludes error batches and zero-VAT documents, exactly as the operator's report does, so the totals match precisely.
- Ex-VAT, VAT and Inclusive figures for each document type, a Net line (Invoices + Debit notes - Credit notes), monthly rows and grand totals.
- The current month is highlighted; exports to CSV and prints with the branded header.
- At head office each branch's figures are synced down and shown both per branch and consolidated across the group.

■ Sales Commission reporting

Monthly sales-commission reports that reproduce your existing spreadsheet, drawn directly from Sage, with automatic archiving and careful per-rep accuracy.

- Sage-native queries that reproduce the operator spreadsheet, including the Sweets and Cigarettes+Tobacco splits and reference rate.
- Commission calculated on paid sales, with a clear, collapsible per-rep breakdown of any unpaid invoices.
- A clawback workflow for invoices that remain unpaid across periods, floored at zero so a return or credit note never credits the rep.
- Automatic month-end archiving, bundled per site as PDFs and pushed to head office, with safe re-runs of closed periods.
- A printed report with dedicated Unpaid Invoices and Clawback pages and right-aligned numeric columns.
- An administrator query-override panel and a configurable filename branch tag.

■ Inventory & sales analytics (Trends)

New reporting that compares inventory and sales year over year, highlights top sellers by season and surfaces slow-moving stock, for a single site or the whole group.

- Customer and Inventory views, the Inventory view split into Sales reports, Seasonal, Mix and Movement sub-views.
- Top ten items per South African season, with commodity codes shown as names (Sweets / Cigarettes / Tobacco / Mixed).
- Year-over-year charts that enumerate every year in the data (no rolling-window gaps), with a site filter.

- Dead-stock view restricted to stock currently held, so the list is actionable.
- Inventory history extended to three calendar years to support the comparisons, with operator-friendly chart subtitles.

■ **Reporting Dashboard & Sage health**

A new at-a-glance home for reporting: headline figures and a summary card for each report, with a strip that shows whether your Sage data is current.

- Summary cards for Aged Debtors, Aged Creditors, Sales Rep Exposure, Inventory Value and BAT, each opening the full, filterable report in one click.
- A Sage health panel that shows 'Unavailable' rather than a misleading green when the connection cannot be reached.
- The Aged Creditors card is filtered to vendors you actually pay, and the Aged Debtors headline matches the Customer Balances screen.

■ **Proactive Insights feed with no-code rules**

The application now surfaces what needs attention on its own, as a ranked feed, rather than waiting for someone to open a report.

- Detects falling sales, customers buying less, dead stock building up and large debtor exposure.
- Administrators can add their own rules in plain language (for example, alert me if revenue drops more than 10%).
- The feed is pre-computed and cached after the nightly sync and refreshed when data changes, so it loads instantly.

■ **Reorder planning**

See exactly what to order and when: items at or below their reorder point, grouped by supplier, with an exportable purchase sheet.

- Click any item to view its sales trend and seasonality before committing to an order.

■ **Inventory Movement**

A new view of how quickly stock is selling, so slow and dead stock is easy to spot.

- Sell-through velocity per item, with dead-stock highlighting.
- Figures roll up across sites for a group-wide picture at head office.

■ **Stock Receipt Expiry tracking**

Capture expiry dates against stock as it is received, kept in step with your Sage purchase orders, so you can stay ahead of short-dated stock.

- Per-line expiry capture as goods are received against a Sage purchase order.
- Reversed receipt lines are reconciled automatically, so quantities stay correct.

■ **Monthly Reports menu, with its own access control**

A new Monthly Reports area groups the Monthly Sales Figures and Sales Commission reports together, behind a single permission so you decide who can see them.

- Administrators and anyone who already had Sales Commission access keep it automatically.

■ **Collections, price lists and account families**

Several day-to-day tools to chase money and find the right account.

- Collections worklists keep each rep on their assigned outstanding accounts; auto-detected payments come off the list and everything else stays manual.
- A printable price list on your letterhead for quick reference.
- Linked customer accounts: a prefixed sub-account now shows its full account family, navigable from either side.

- A tool that tidies up Sage credit-note descriptions for cleaner, more consistent records.

■ Downloadable reports, fast search and saved views

Reports are easy to share and file, and the whole application is quicker to move around.

- Aged Debtors and Sales Rep Exposure download as a polished PDF or an Excel workbook that matches your on-screen filters.
- A command palette (Ctrl/Cmd-K) jumps to any page or report instantly.
- A notifications bell flags anything needing attention from anywhere in the app.
- Report filters are kept in the page link, so a filtered view can be bookmarked or shared, and favourite views saved and reopened in one click.

Improvements

IMPROVED

■ Balances that reconcile to Sage

Customer and creditor balances are now built directly from Sage's open items, so on-screen totals match Sage to the cent rather than a balance that could drift over time.

- Aging summary tiles on the Customer Balances and Creditor Balances screens that always match the filter you have applied.
- The Customer Balances age filter is driven from the open-item ledger, so filtering by period is accurate.
- Location and Terms shown per customer, with a National / Standard account filter.

■ Branded, print-ready reports

Every report now prints as a professional document.

- Your depot name (from Settings) and logo appear as a header on every report's print and PDF.
- Reports fit a single landscape page, print in solid black for clarity, and no longer carry a faint watermark.
- Fixed a long-standing issue where the branded header did not appear at all when printing.

■ Clearer navigation and tidier screens

The application is easier to find your way around.

- Menus reorganised into logical groups; the sidebar tidied into a compact account menu; redundant section labels removed.
- Explanatory tooltips added across the new modules.
- Pagination now includes first/last page jumps and a go-to-page box for long lists; summary tables support resizable columns.
- Page headings share a single consistent style across the application.

■ Faster, smoother performance

Reports and dashboards load noticeably faster and feel more responsive.

- A dedicated frontend performance pass, plus database query optimisations (including replacing a slow reconciliation query and a faster, cached insights query).
- Tidy loading placeholders instead of blank screens, and a one-click retry if something fails to load.
- Configurable data sync: administrators can tune how supplier data is retrieved and how much history is loaded.

Fixes & Reliability

FIXED

■ **Accurate local timestamps**

Recorded dates and times now consistently reflect local (UTC+2) time across the application.

- A central time function used everywhere, with an automated guard that prevents the old behaviour creeping back in.

■ **Problems are surfaced, not hidden**

Issues that previously went unreported are now raised clearly, with system-log telemetry across modules, so they can be resolved sooner.

- Several boot and runtime errors exposed when switching between single-site and head-office views were resolved.
- Head-office multi-site isolation and permission handling were tightened so each site's data and access stay separate.

■ **Commission report accuracy**

The commission figures and printed report were corrected in several ways.

- Dedicated Unpaid Invoices and Clawback pages in the printed report.
- Clawback floored at zero and no longer treats returns or credit notes as a credit to the rep.
- The commission-at-risk total now adds up correctly, and a row-multiplication error was fixed.

■ **Cleaner, correct report figures**

Balance, payment and aging figures were corrected across a number of reports and screens so the headline and the detail always agree.

- The customer pop-up shows only genuinely outstanding invoices and receipts; anything paid or matched off (within a small rounding tolerance) is no longer listed.
- Customers who have not traded in a long time are flagged dormant even at a zero balance.
- Corrected aging dates and period totals across the debtor and creditor reports, and aligned the dashboard debtor headline with the Customer Balances screen.
- Credit balances on the creditor and debtor reports now carry the correct sign on screen, matching the downloads.

■ **Quality and maintenance**

Behind-the-scenes work to keep the application reliable as it grows.

- Large pages split into smaller pieces, a typed boundary added to the data layer, and database migrations reorganised one per version.
- A range of review findings addressed across the release (forecasting calendar gaps, collections dates, response handling and more).
