

This update fixes an issue in BAT reconciliation where invoices with a failed OCR scan were silently excluded from the 'OCR failed' filter. The filter now captures every invoice that OCR could not process, the header badge now uses the same definition of 'OCR failed' as the filter, and any filter that returns no results displays a clear message instead of a blank list.

Fixes

FIXED

■ **BAT reconciliation — 'OCR failed' filter now captures all failed scans**

When filtering the invoice list in BAT reconciliation for 'OCR failed', invoices that had actually errored during scanning (shown with a red 'Failed' badge) were being silently excluded — only invoices with a 'not found' status appeared. The filter now correctly shows every invoice that OCR could not process, regardless of the specific failure type. The 'OCR failed' count in the header now uses the same definition — both cover every invoice OCR could not process. If a filter or tab returns no matching invoices, a descriptive message is now shown in place of a blank list, indicating which filter is active and pointing to the correct tab when relevant.
