

Cardoso — Product Roadmap

PRODUCT ROADMAP

Prepared: 8 June 2026 **Horizon:** June – September 2026

Where we are

Cardoso has grown into a single operating platform for the business: live Sage-300 data, customer and creditor management, BAT reconciliation, JTI reporting, inventory, sales commission, and a reporting suite — all behind role-based access and running reliably, including on air-gapped sites.

The most recent work (June 2026) made the **financial reporting Sage-faithful**: debtors and creditors now age exactly the way Sage does, balances reconcile to the Sage open-item ledgers to the cent, and a new **Monthly Sales Figures** report matches the operator's existing Sage figures exactly. Reports are now branded and print-ready.

This roadmap sets out where we take the platform next, organised into three horizons. Dates are planning targets and will be confirmed sprint by sprint.

Guiding principles

These hold across everything below:

- **Sage is the source of truth.** Every figure must reconcile to Sage. We build to match Sage's own methods, not approximate them.
- **No silent failures.** If something doesn't sync or reconcile, it is surfaced — never hidden.
- **One number, everywhere.** A value shown on a screen, a tile, a hub summary and a printout must always agree.
- **Multi-site by design.** Everything is built to work for a single depot today and to consolidate across all depots at the Hub.

Horizon 1 — Now (June – July 2026)

Theme: Finish the reporting rollout & operational visibility

Multi-site reporting at the Hub. Bring the new Sage-faithful reports — Aged Debtors, Aged Creditors and Monthly Sales Figures — fully live at head office, with each branch's figures synced down and presented both per-branch and consolidated. *Outcome: head office sees every depot's receivables, payables and sales in one place, reconciled to Sage.*

Operational visibility (Job Control Centre). A single screen showing every background process — Sage syncs, backups, reconciliation, exports — with its status, last run, next run and last error, plus one-click retry for administrators. *Outcome: the team can see at a glance that the overnight syncs ran, and fix anything that*

didn't *without calling support.*

Proactive alerts. Automatic notification (email first) when a critical job fails — a sync, a backup, a reconciliation — with sensible de-duplication so the team isn't flooded. *Outcome: problems are known within minutes, not discovered days later.*

Horizon 2 — Next (July – August 2026)

Theme: Transparency & data quality

Transparent access control. A clear "why can / can't this user see this?" view for administrators, a preview of a user's access before saving changes, and an exportable permission matrix. *Outcome: access questions are answered in minutes, and changes are made with confidence.*

Data-quality monitoring. Automated nightly checks that surface duplicates, missing fields and Sage-vs-Cardoso reconciliation mismatches, with trends and a simple "issues to review" queue. *Outcome: data problems are caught and worked proactively rather than discovered in a report.*

Saved views. Let each user save their preferred report and reconciliation filters, with optional shared team presets. *Outcome: faster day-to-day work; everyone lands on the view they need.*

Horizon 3 — Later (August – September 2026)

Theme: Performance, safety & scale

Performance monitoring. Visibility into how fast key screens and exports respond, so slow points are identified and improved before they affect the team.

Configuration safety. A safe, secret-redacted view of the system's configuration, with warnings for risky combinations and clear "restart required" indicators — reducing the chance of a configuration change causing an outage.

Incident timeline. A single, time-ordered view of deploys, job events, alerts and manual actions, so any issue can be understood and reviewed quickly.

What success looks like (by end of horizon)

Measure	Target
Reporting reconciliation to Sage	To the cent, across all depots
Undetected failed overnight jobs (older than 4 hours)	Near zero
Time to know about a critical failure	Under a few minutes
Time to resolve an access question	Under 2 minutes
Reconciliation exceptions older than 7 days	Reduced by ~25%
Response time on key screens	Improved and monitored

Delivery approach

- Short, regular release cycles (roughly every two weeks) with a tested rollback

path on each.

- "Done" includes automated tests and reconciliation against Sage.
- Priorities reviewed with the business each cycle — this roadmap is a living plan, not a fixed contract.

Cardoso · Confidential — prepared for the business.
