

Cardoso Release Notes — 2026-06-08

RELEASE NOTES

Covering **1–8 June 2026**.

A major **accounts-receivable & accounts-payable reporting** release. The headline is a complete, **Sage-300-faithful aging system** — debtors and creditors now age exactly the way Sage does, off the live open-item ledgers — together with a new **Monthly Sales Figures** report, a **Monthly Reports** module with its own access permission, an **Aged Creditors** dashboard tile, and a polished, **branded print/PDF** experience across every report.

It builds on the **v2026.5.8** platform drop (2 June): the reporting dashboard, the Insights feed, demand forecasting, commission archiving, and the JTI self-heal.

Aged Creditors — new report (Sage A/P method)

A brand-new **Aged Creditors** report, built to match the Sage 300 Aged Payables trial balance exactly:

- Every open supplier document is aged **individually by its due date** and **distributed** across Sage's monthly periods — **Current / 1–30 / 31–60 / 61–90 / Over 90** — so a vendor correctly spans several buckets instead of having its whole balance dumped into one.
- Sourced from the live **APOBL** open-item ledger (the same documents Sage ages), so the report reconciles to Sage to the cent.
- Full **CSV / Excel / PDF** export with per-bucket columns and a totals row.
- Reachable from **both** the Reports page (for reporting users) and the Creditors module (for creditor users).
- **Hub all-sites** support with a Site column and correct per-site vendor scoping.

Underneath it is a new **shared Sage-300 aging engine** that now powers both the debtor and creditor reports from a single, tested code path.

Aged Debtors — rebuilt on the Sage open-item ledger

The Aged Debtors report previously dumped each customer's **entire** balance into a single bucket based on the oldest invoice — Sage's pre-aged figures weren't present in the synced data, so per-document aging wasn't possible.

This release introduces a new **AR open-item ledger** synced from Sage **AROBL**, and rebuilds the report on top of it:

- Every open invoice, credit note and debit note is aged **individually** into Sage's weekly periods — **Current / 1–7 / 8–14 / 15–21 / Over 21** — by document date.
- **National-account children roll up** under their national account (and

inherit the parent's sales rep / account type), matching how Customer Balances rolls them up.

- The report now reconciles to the live Sage open items rather than a drifted master balance.

Customer & Creditor Balances

- **Customer Balances rebuilt on the AR open-item ledger.** The screen now reconciles to the Sage open-item total to the cent, instead of tracking the master balance that had drifted from the underlying invoices.
- **Aging summary tiles** added to both the Customer Balances and Creditor Balances screens, and made **filter-aware** — the tile totals always match the list under any filter (account type, sales rep, site, etc.).
- **Customer pop-up cleaned up** — it now shows only **genuine open items**. Invoices that have been paid, and receipts that have been applied, net out and disappear; anything within a **R0.02 rounding tolerance** is hidden. No more phantom invoice/receipt rows on a zero-balance account.
- **Location and Terms** columns brought in per customer from Sage, plus a **National / Standard** account-type filter.
- New **Creditor Balances filter**: show only creditors that have ****historically been paid**** (blank last-payment-date excluded), on by default.

Monthly Sales Figures — new report

A new report replicating the Sage "Sales Figures" Crystal report:

- **Posted invoices, credit notes and debit notes by month**, with VAT shown separately — **Ex-VAT/ VAT/ Incl** for each document type — plus a **Net** column (Invoices + Debit notes " Credit notes) and grand totals.
- Sourced live from the Sage **ARIBH** invoice batches, document type by TEXTTRX, VAT-bearing documents only — so it matches the operator's existing Sage figures **to the cent**.
- The current month is highlighted; **CSV** export and **print** included.
- Available **per branch at the Hub**: each branch's figures are synced down and shown as a consolidated table plus one section per branch.

Monthly Reports module + permission

- A new **"Monthly Reports"** sidebar group containing **Monthly Sales Figures** and **Sales Commission**.
- Gated by a new, admin-toggable **"Monthly Reports"** permission (can_access_monthly_reports). Existing administrators and anyone who already had Sales Commission access keep it automatically.

■ Reporting Dashboard

- New **Aged Creditors** summary tile (total outstanding, vendor count, monthly buckets), filtered to vendors **with payment history**, deep-linking to the report.
- The **Aged Debtors** tile now shows the ****positive-balance total that matches the Customer Balances page**** (the "who owes us" figure) rather than the net open-item figure, and its bucket rows were corrected to the new aging periods (they had silently shown R0).

■ Print & PDF — branded, professional

- Every report's print/PDF now carries a **branded header**: the ****Cardoso logo, the depot name (pulled from Settings !' Depot Details**)**, the report title, the selected period, and a generated timestamp.
- Fixed a long-standing bug where the branded header/footer **never rendered** (an inline display:none the print stylesheet couldn't override).
- Removed the faint **"CARDOSO LEDGER" watermark**.
- Reports now print **solid black** (the on-screen greys washed out on paper), **fit one landscape page** (no more clipped columns / blank second sheet), and the dense Sales Figures table no longer wraps.

■ Interface consistency

- Standardised every page heading on the app's **editorial heading style** (display serif, accent last word, trailing period) — Insights, the Reporting Dashboard, Sales Commission and Monthly Sales Figures now match the rest of the application.

■ Credit analysis

- Customers that haven't transacted in over the dormancy window are now correctly flagged **Dormant** even when their balance is zero (previously they could be auto-approved).

■ Platform — v2026.5.8 (2 June)

The reporting-platform release this period also delivered:

- **Reporting Dashboard** with a Sage health panel.
- **Insights** — an automatically surfaced feed of changes and risks, with no-code rules.
- **Demand forecasting / reorder** signals.
- **Sales Commission** archive + PDF, hardened for closed-period runs.
- **JTI** monthly-export daily self-heal.
- A **frontend performance pass** and routine dependency/security updates.

Database

Four new migrations (apply automatically on first boot):

Migration	Purpose
v091	Debtor AR open-item ledger (`debtor_ar_invoice`) + hub mirror
v092	Reporting-account column on the ledger (national-account roll-up)
v093	Hub AR Document Summary table (per-branch sync-down)
v094	`can_access_monthly_reports` permission (admins + existing commission users backfilled)

Test plan

1. **Aged Creditors** — open from Reports; confirm vendors span buckets and the total reconciles to Sage APOBL. Export PDF/Excel. 2. **Aged Debtors** — confirm per-document aging and that national-account children roll up under the parent. 3. **Customer Balances** — confirm the grand total matches Sage open items and the aging tiles match the list under a filter; open a customer pop-up and confirm only genuine open items show. 4. **Monthly Sales Figures** — pick a month and reconcile Invoices / Credit Notes against the Sage Sales Figures report; print and confirm the branded header + one-page fit. 5. **Monthly Reports permission** — toggle "Monthly Reports" off for a test user; confirm the group disappears and the endpoints 403. 6. **Dashboard** — confirm the Aged Creditors tile (paid-history vendors) and that the Aged Debtors tile matches the Customer Balances total. 7. **Print** — print any report; confirm logo + depot name, no watermark, black text, single page.

Behind the scenes

Verified in dev: tsc typecheck clean, vite build clean, vitest suite green, and each backend change exercised against the live Sage connection where applicable (Aged Creditors, Aged Debtors, Monthly Sales Figures all reconciled to Sage). Hub-only paths are wired to the proven sync pattern but should be verified on a hub install after its first ETL cycle.
