

This update (v2026.5.9.8) adds a new Sales by Vendor report and a breakdown of BAT exceptions by reason. Report printing has also been tightened: the page footer no longer bleeds into table content, and week blocks in the BAT Exceptions report stay together across page breaks.

New Features

NEW

■ Sales by Vendor report

A new report shows all item sales per vendor for any date range you choose. Filter by vendor, toggle a year-over-year comparison to see how each vendor's sales track against the same period last year, and switch to a month-by-month matrix for a detailed breakdown. Vendor names are sourced directly from the Sage vendor master so they are always accurate.

■ BAT Exceptions by Week — totals by exception reason

The BAT Exceptions by Week report now shows the total value of exceptions broken down by reason, so you can see at a glance which exception types are driving the most variance each week.

Fixes

FIXED

■ Report footers no longer overlap table content when printing

The footer on printed reports now flows naturally at the bottom of the page and no longer bleeds into the last rows of a table.

■ BAT Exceptions week blocks stay together across page breaks

When printing the BAT Exceptions report, each week's block is now kept whole — entries for a week are no longer split across two pages.
