

This update centres on the Sales by Vendor report. The former CSV export has been replaced with a full Excel workbook: a year-over-year Dashboard tab highlighting the top movers, per-month quantities, prior-year comparison figures, and all amounts in Rand — ready to pivot and chart without any manual setup. Head-office users receive the same data broken out by branch. Accompanying accuracy improvements sharpen the year-over-year rankings, and under-the-hood fixes make inventory syncing more resilient and self-healing.

New Features

NEW

■ Excel export with year-over-year dashboard for Sales by Vendor

The Sales by Vendor export is now a formatted Excel workbook instead of a plain CSV. It includes a Dashboard tab with the Top-10 year-over-year movers by value, a long-format Data sheet with Year and Month as separate columns ready for pivot charting, prior-year quantities alongside current figures, and all amounts in Rand.

■ Per-branch breakdown at head office

When viewed from the hub, the Sales by Vendor Excel export splits the data by branch, giving head-office users a complete per-depot picture in a single workbook.

Improvements

IMPROVED

■ Year-over-year figures shown per month

On the Sales by Vendor report, year-over-year comparisons are now broken down by month, making seasonal patterns and monthly swings easier to read.

■ Same-day recovery for failed nightly syncs

The scheduled data sync now runs an hourly catch-up during the day, so a branch whose nightly sync failed no longer has to wait until the following night to get current figures.

Fixes

FIXED

■ Top-10 year-over-year movers show only true comparisons

Items that had no sales in the prior year are no longer included in the Top-10 movers list. The ranking now compares only items with sales in both years, giving a meaningful year-over-year view.

■ Money amounts stay on one line in the by-month matrix

Large Rand amounts in the Sales by Vendor by-month view no longer wrap onto a second line.

■ Inventory sync is more robust

The inventory sync now stages data before committing it, so a sync that fails partway through cannot publish a half-built result. Concurrent syncs no longer produce duplicate rows, and the sync no longer stalls other parts of the application while running.
