

This update centres on the proof-of-delivery (POD) viewer in BAT reconciliation. You can now page through every page of a multi-page POD document directly in the app, rotate pages to any orientation, and see previews for historical deliveries — right back to your earliest records. Sideways pages are straightened automatically, existing previews are preserved if a new render fails, and the viewer no longer clips tall documents. The app also stays responsive while previews are being generated in the background.

New Features

NEW

■ Multi-page POD document viewer

Proof-of-delivery documents with more than one page can now be paged through directly in the app — no need to download the file. Use the forward and back controls to step through each page of a delivery document.

■ Rotate documents in the POD viewer

Left and right 90° rotation buttons let you correct the orientation of a sideways or inverted document without leaving the reconciliation screen.

■ Historical POD previews

Deliveries processed before the preview feature was introduced now show their POD previews too. The Operations OCR panel displays backfill progress week by week, so you can track how much of your history has been filled in.

Improvements

IMPROVED

■ Sideways pages auto-straightened

When a POD document contains pages that were scanned or photographed sideways, those pages are now automatically rotated upright for comfortable reading.

■ Existing preview preserved on render failure

If a new render attempt encounters a problem, the previously confirmed preview is kept in place rather than being replaced with an error, so a working view is never lost.

Fixes

FIXED

■ POD preview no longer shrinks

A stray height limit in the viewer was compressing tall documents. It has been removed — previews now display at their full size.

■ App stays responsive while previews generate

Background preview generation previously competed with the interface for processing time, causing occasional sluggishness. The work is now properly offloaded so the app stays fast while previews are being built.
