

This update (v2026.5.10) adds a write-off candidate picker that exports a formatted PDF of items flagged for write-off, and resolves a performance issue in BAT reconciliation where preview rendering could slow the interface and re-OCR'd rows were not always shown correctly.

New Features

NEW

■ Write-off candidate picker with PDF export

A new tool identifies inventory items flagged as write-off candidates and exports the list as a formatted PDF, ready to review with management or file for audit purposes.

Fixes

FIXED

■ BAT reconciliation preview no longer slows the interface

Loading a BAT reconciliation preview could make the interface sluggish or briefly unresponsive. Preview rendering now yields correctly so the interface stays smooth. Rows that have been re-processed by OCR are also displayed accurately after the update.
