

This update advances the off-site backup capabilities of the Cardoso App. Head-office users can now see the status of each site's off-site Kopia backup directly on the Hub Backups page, with proactive alerts when a backup is stale or has encountered an error. The Kopia backup agent is now bundled in the Windows installer so it deploys automatically alongside the app. Backup health tracking has been rebuilt to be more accurate and resilient — it no longer depends on the scheduler staying alive, failed backups retry automatically, and the off-site agent guards against uploading outdated data. A fix also eliminates a BAT reconciliation annoyance where historical OCR error notifications re-appeared each time the page was opened.

New Features

NEW

■ Off-site backup status on the Hub Backups page

The Hub Backups page now shows the current state of each site's off-site Kopia backup alongside the local backup status. When a backup is stale or the repository reports an error, a proactive alert is raised so nothing slips through unnoticed.

- Per-site off-site backup status (last snapshot time, freshness verdict, any repository error) shown directly on the Hub Backups dashboard.
- A new alert rule fires when a site's off-site backup is overdue — surfaced in the existing Insights / Alerts feed.
- Status is scoped to the sites each head-office user is permitted to see.

■ Kopia backup agent bundled in the Windows installer

The Kopia off-site backup agent is now included in the Windows installer package. New and updated installations receive the backup agent automatically — no separate download or manual setup step required.

Improvements

IMPROVED

■ More reliable and accurate backup health reporting

Backup health is now assessed from the actual state of the backup files rather than relying on the Windows Task Scheduler to report success. This means the health indicator stays correct even when the scheduler is stopped or has not yet run.

- A failed local backup now retries automatically on a back-off schedule, catching up on any missed windows.
- A data-age guard stops the off-site snapshot agent from uploading a stale copy — if the local source hasn't been updated recently, the snapshot is deferred until fresh data is available.
- The hub's backup health verdict now reflects the actual backup outcome rather than defaulting to the data age alone.

Fixes

FIXED

■ BAT reconciliation — old OCR errors no longer re-notify on every open

Historical per-row OCR errors from previous reconciliation runs were re-appearing as notification toasts each time the BAT Reconciliation page was opened. They are now seeded quietly on load and only surface as live notifications when OCR is actively running in the current session.

- **Hub Backups page surfaces Kopia repository errors**

When the off-site backup agent encounters a repository problem — such as a connectivity failure or a corrupt snapshot — the error is now shown on the Hub Backups page rather than the site appearing healthy.
