

This update (v2026.5.9.5) is about seeing — and printing — the detail behind your numbers. A new Inventory Movement History gives every item a 'stock card': every sale, receipt, credit, adjustment, write-off and transfer, with a running balance that reconciles to your on-hand stock figure. The Daily Sales report can now print every invoice, credit note and debit note for a chosen day, and the BAT reconciliation lists print on a letterhead sheet. Installing and updating a branch is also faster. Every figure continues to be drawn from, and reconcile to, Sage.

New Features

NEW

■ Inventory Movement History — a stock card for every item

A new Movement History tab on the Inventory page shows, for any item, a dated list of every movement — sales, purchase receipts, customer credits and returns, adjustments, write-offs and transfers — with a running balance that reconciles to your on-hand stock figure.

- Search for an item, choose a date range, and read its movements oldest-to-newest with In / Out / running Balance / cost columns and colour-coded movement types.
- The running balance is anchored to the on-hand quantity from your last sync and worked backwards, so the card always ties out to that on-hand figure — even though Sage purges old transaction history (a balance summed from zero would not).
- Opening and closing balances for the period, total in/out, and current on-hand are shown as tiles, with an 'anchored to on-hand' check.
- For speed it loads the last 30 days by default — synced in the background with live progress — and a 'Load full history' button pulls a single item's complete record from Sage on demand. A clear notice appears if you look back further than what's been synced, so a partial view is never mistaken for the whole.
- The figures reflect your most recent sync from the branch's Sage — run a sync for the latest movements and on-hand. Export the stock card to CSV, or print it on the depot letterhead (per branch).

■ Print a day's documents from Daily Sales Figures

On the Daily Sales Figures report, each day now has a Print button that lists every invoice, credit note and debit note posted that day on a letterhead sheet.

- Documents are grouped by type — Invoices, Credit Notes, Debit Notes — with per-type subtotals and a net total; each line shows the document number, customer, order and the VAT split.
- It uses the same source and filters as the day's summary row, so the printed list always reconciles to the figure on the report.
- Printed on the depot letterhead with the date, ready to file or hand over.

■ Print the BAT reconciliation lists

The Paid, Non-Compliant and Exceptions lists in BAT reconciliation each gain a Print button that produces a letterhead sheet of that list.

- The header states the depot, the year and week number, and which list was printed.
- Each invoice row carries its order number, customer, delivery and POD-upload dates, OCR status, invoice number and amount, with the list total at the foot (and the exception reason on the Exceptions list).

■ **Faster, more robust branch installation**

Installing or updating the app on a branch machine is now noticeably quicker, and an interrupted update is safer.

- The application's libraries ship as a single compressed archive and are unpacked in one pass, instead of copying tens of thousands of small files individually.
- An interrupted update can no longer leave a half-updated install running quietly: the installer clears the old libraries first, verifies the new ones unpacked, and stops with a clear message if anything went wrong.
